Equal fit counts produce different kinds of information

Method	Use of the 140-fit budget	Noise handling during search	Primary information gained
Blocked DOE	25 planned coordinates	5 split blocks	effects, interactions, curvature
Random search	140 sampled coordinates	one development split	broad non-adaptive exploration
TPE variants	140 adaptive coordinates	one development split	concentrated optimization

The benchmark repeated each search 20 times and retrained fixed selections across 20 evaluation seeds.
